

Drive In

With its minimal number of aisles, drive- in racking takes maximum advantage of available space.

Drive-in is ideal for storage of products when rotation is not a crucial factor.

It is recommended for warehouses where a high number of pallets per individual article (minimum 8 to 12) exists, as each aisle is dedicated to a single article.

A minimum number of aisles is needed for fork lift maneuver, so that most of the available floor plan can be used for storage.
