

Boltless Shelving

Our Aplic boltless shelving system is used for manual storage of small and medium sized loads.

Shelves can bear loads of up to 1,257 lbs. per level, depending on their dimensions. For great flexibility, load levels can be adjusted every 1 5/16".

Uprights are blue and beams are grey.

Shelves are made of particle board and they use true sizing, that is, the actual measurements indicated in our load tables are the dimensions of the panel, and not the dimensions of the outer panel supports, as is common in the industry.

This can represent huge savings because standard wood sizes can be used instead of cutting panels to non standard sizes in order to customize the shelf to the available size between panel supports.
